

## RUST REMOVAL

50% acetone 50% ATF and a 3M scrubby to get rid of the rust...  
clean w/ turps or similar..

A rubbing brick will quickly remove/speed up really heavy rust...

then go here...

cutting fluid and a rubbing stone to lessen or remove the pits...

finish w/ progressively finer grits of wet/dry till you have achieved happiness...

**CIRCULAR MOTIONS ONLY PLEASE**

**the ratios are...**

1 qt. of motor oil to 3 cups of dish washing liquid to 4 gallons of water....

Add the liquid soap to the water. Mix the soap into the water so that it is dissolved. The soap is the catalyst that will enable the oil and the water to mix; otherwise the different densities will make the oil float on top of the water.

**small batch ratios...**

1oz motor oil...

1.5oz dish soap...

32oz water...

**divide** by two if want a still smaller batch...

the rubbing stone(s)/bricks...
